receptors in retroviral infections, to their role in inflammation, angiogenesis/angiostasis, and tumor cell biology. The book examines in detail fifteen recently identified chemokines and elucidates the role of chemokine function in vivo from animal experiments. Animal models are also used to explore how chemokines operate in a variety of chronic and acute inflammatory diseases and in noninflammatory processes. A detailed review of the emerging role of chemokines in viral biology is also presented, with emphasis on HIV biology and novel therapeutic possibilities. *Chemokines in Disease: Biology and Clinical Research* summarizes the rapidly expanding knowledge of a dazzling array of chemokines and provides fresh insights into the development of powerful new drugs for treating a wide spectrum of diseases.

This book brings together in one volume two earlier books by the authors, now revised to meet the challenges of 21st century scholarship in African performance and cultural studies. Topics covered range from sources of oral traditions, the relevance of cosmology to oral performance, myths and legends, occupational and heroic poetry to name but a few. The central theme is performance and the reader is provided

Church tradition has long held that humanity arose from two people living in a garden of paradise in the Mesopotamian basin roughly six thousand years ago. Scientists now have abundant evidence that the human population never numbered less than ten thousand, originated out of Africa hundreds of thousands of years ago, and descended from ancestors that we share in common with several other species (some now extinct, some still living). Is it possible to make these two starkly different worldviews agree, or do we have to choose one and discard the other? This book will summarize the fossil and genetic discoveries that support the scientific view, and then address the impact that this has upon many Christian

theological tenets. In the process, it presents many examples of the church adjusting long-held traditions and teachings in the face of scientific advances, as well as examples of how we often hold two seemingly contradictory ideas together without feeling a need to discard one of them. Many theologians have written on this topic without adequately incorporating the scientific aspects. Many others have addressed the science without exploring the impact on theology. This book accomplishes both.

Light and Life in the Universe: Selected Lectures in Physics, Biology and the Origin of Life is a collection of lectures given at the 1964 Nuclear Research Foundation Summer Science School for High School Students, held at the University of Sydney, Australia, on January 6-17, 1964. The papers explore various aspects of life, both on earth and in the universe generally. Emphasis is placed

on the "units" of living matter, how life may have started on earth, and the possibility of life on other planets. This book is comprised of 15 chapters and begins with a brief description of some of the properties of atoms and how they join up to form molecules, as well as some of the properties of the central core of each atom. The discussion then turns to electromagnetic radiation, highlighting the difficulties originally encountered by Ernest Rutherford's picture of the atom. Subsequent chapters focus on the influence of gravitational fields; the origin of the solar system; the evolution of life on earth; and link between the primordial atmosphere and the origin of life. The functions of proteins, the practical effects of biology on humans, and the replication of living molecules are also considered. This monograph is written specifically for fourth-year high school students interested
